

ASSEMBLY INSTRUCTIONS

To facilitate installation of constant supply water feed tube from gun through the body of the LaserShark, proceed as follows:

1. Inflate the LaserShark. Your LaserShark ride-on toy is made of a sturdy vinyl, designed to be firmly inflated, however use good sense, **DO NOT OVER INFLATE!**
2. Find the (2) hard plastic tubes supplied with the LaserShark. These tubes are designed to act as a "tunnel-way" or "conduit" to allow easy insertion of the water tube that supplies the gun.
3. Using the palm of your hand, gently press one of the two plastic conduit tubes down into the body of the LaserShark. See Illustration "A" .

4. Now take the second conduit tube and press it down into the body of the LaserShark as well. This will create a continuous tunnel-way through the water feed tube hole in the body of the toy. The first of the two conduit tubes will now be exposed at the bottom of the LaserShark. See Illustration "B".

5. Install the gun by feeding water supply tube through the conduit tunnel you have created. Finish installation by removing and discarding the first conduit tube that protrudes from the bottom of the LaserShark. Press Gun with water feed tube down firmly into body of LaserShark. Water feed tube should now be protruding from bottom as required. The remaining conduit stays within the LaserShark to assure easy flow of water and eliminate "pinch-off" of water feed tube. See Illustration "C".
